Care instructions.

Colorpan balcony and façade profiles

Colorpan balcony and façade profiles require no special maintenance or care to remain fit for use.

**Cleaning light soiling**

Clean only with typical non-abrasive household cleaners and a soft brush. Moisturising washing-up liquid, such as Fairy®, may not be used. Suitable products include vinegar-based cleaning agents without tensides. Rinse with clean water after cleaning.

**Cleaning heavy soiling**

In event of heavier soiling, a scouring cream may be used, such as Cif®. Apply the scouring cream to a household sponge (fine side) and rub the entire surface of the profiles evenly, applying light pressure. Rinse with clean water after cleaning.

When washing the profiles (approx. once per year), paint particles worn off by weathering are rinsed off, making the washing water change to the colour of the profiles. This is not a defect, the paint is not coming off.

No nitrocellulose thinner, white spirit, etc. may be used.

When using a high-pressure cleaner or steam cleaner, the distance between the nozzle and the WERZALIT surface must be at least 30 cm. The water temperature may not exceed 50 °C.

WERZALIT polish may not be used, because this would prevent a re-application of Colorpan acrylic paint.

Special instructions can be requested in event of algae growth.

If large areas of the paint surface are damaged, these areas must be touched up with Colorpan acrylic paint. The visible portion of the façade must then be coated completely since small colour differences would otherwise be visible. In event of large gaps, it is necessary to prime first with adhesive primer “Disbon 481 EP-Uniprimer” (see the application instructions for the Disbon coating on our website).
